Where to Find Modem Name & Password

Note: You must set up your computer and other client devices to work with the security settings on the TG2472G. Refer to the documentation for your client device for instructions on setting security. On most computer systems you only need to select the network name (SSID) device and enter the encryption key. If your computer or client device supports Wi-Fi Alliance WPS (Wireless Protected Setup), activate WPS on your computer or client device and the TG2472G simultaneously to easily set up your system security.
